oDO Sensor in Spec after Six Weeks Deployment

From the end of June through the first week of August, 2006, Eureka Environmental deployed a Manta Multiprobe with the assistance of a research institute in Corpus Christi. After six weeks in the warm gulf waters, barnacles had completely encrusted the Manta, which we equipped with our new oDO (optical dissolved oxygen) sensor. After retrieving the instrument, Dr. Russell Seguin of Eureka performed a post calibration and determined that the instrument was still performing within specifications.

Additional Pictures:

Eureka is currently soliciting ideas for barnacle removal.
